ASSASSIN BUGS (INSECTA: HETEROPTERA: REDUVIIDAE) IN COLLECTIONS OF THE NATURAL HISTORY MUSEUM IN BELGRADE

LJILJANA PROTIĆ

Natural History Museum, Njegoševa 51, 11000 Belgrade, Serbia,
e-mail: protic@nhmbeo.rs

This paper presents the information on specimens from the family Reduviidae (Heteroptera) stored in the Entomological Collection of Natural History Museum in Belgrade (376 examined specimens, belonging to 28 species). *Empicoris vagabundus* (Linnaeus) is a new species to the fauna of Serbia. *Oncoccephalus pilicornis* Herrich-Schaeffer is a new species to the fauna of Montenegro. Most specimens were collected in Serbia, Macedonia and Croatia (Dalmatia). This paper also includes data on species collected after the publishing of the Catalogue (Protić 1998) and some older records which were stored in the Collection for decades without being published.

Key words: Heteroptera, Reduviidae, Natural History Museum in Belgrade

INTRODUCTION

Specimens of the family Reduviidae in the Entomological collection of the Natural History Museum were examined within the regular museum activities: identification, inventory, checking and conserving the Heteroptera specimens. It was determined that they are included in following

collections: Study Collection of Heteroptera (SZ), Collection of Heteroptera by Nikola Kormilev (NK), Collection of Insects by Petar Novak (PN), Collection of Insects by the Institute for Plant Protection (PP), Collection by Ljubodrag Janković (LJJ), and Collection by Zoran Gradojević (ZG). The data from the oldest (initial) collection were already published (Protić 2008). These specimens were mostly collected in Serbia with significant representation of other republics of Former Yugoslavia as well as individual specimens from Austria, Brazil, Greece, Italy, Hungary, Morocco, Germany, Romania, Tunisia, and Venezuela. The Entomological Collection of Natural History Museum includes individual specimens from India (in the butterfly collection by Andraš Galac) and Africa (present to Presidency of Yugoslavia in 1982 from Guinea), which were not identified due to lack of appropriate determination keys.

There are some data on reduviids of Serbia within the faunistic studies (Horváth 1903, Kormilev 1936, 1943; Protić 1993) and systematic catalogues (Protić 1990, 1998).

This paper includes the first published data for the Study Collection of Heteroptera collected after 1993, as well as the data from other collections of Heteroptera in the Natural History Museum which were not published in the catalogue (Protić 1998).

Some changes and additions are proposed to the Catalogue of the Heteroptera of the Palearctic Region (Putshkov & Putshkov 1996) about the distribution of certain species in the territory of ex-Yugoslavia.

MATERIAL AND METHODS

Representatives of the family Reduviidae are large insects and their unusual shape and attractive colors attract not only entomologists but also other naturalists, botanists, zoologists, forestry workers, geologists, agriculture engineers, environmentalists. Names of all collectors were recorded next to the specimens they had collected. Here we will list the names of curators and close associates of the Natural History Museum: Živko Adamović, biologist, curator-entomologist; Ljiljana Andjus, biologist, curator-entomologist; Danka Tripković-Čubrilović, biologist, curator-entomologist; Nikola Diklić, biologist, curator-botanist; Zoran Gradojević, biologist, entomologist; Predrag Jakšić, biologist, entomologist; Ljubodrag Janković, forestry engineer, entomologist; Miroslav Jovanović, agriculture engineer, curator-botanist; Velika Jovanović, curator for millipedes; Nikola Kormilev, agriculture engineer, entomologist; Vladimir Martino, biologist, curator-ornithologist; Ljubodrag Mihajlović, forestry engineer, entomologist; Petar Novak, entomologist (Split); Guido Nonveiller, Faculty of Agricul-

ture, environmental conservationist and entomologist; Milan Paunović, biologist, curator-mammaliologist; Dragan Pavićević, entomologist; Petar Pavlović, geologist, 1st Director of Natural History Museum in Belgrade; Boris Petrov, biologist, curator-mammaliologist; Ljiljana Protić (Kašić), biologist, curator-entomologist; Marko Raković, biologist, curator-ornithologist; Aleksandra Rohalj, biology student; Dragiša Savić, biologist, botanist (Sremska Kamenica); Aleksandar Sigunov, forestry engineer, botanist; Jovan Stančić, Faculty of Agriculture, entomologist (Lyon); Aleksandar Stojanović, agriculture engineer (environmental conservationist), curator-entomologist; Dušan Stojićević, curator-zoologist, 2nd Director of Natural History Museum in Belgrade; Jelena Šeć, biologist (Sombor); Trajče Trajkovski, agriculture engineer, environmental conservationist and entomologist (Marvinci); Marija Vujanić, biologist; Milan Živković, preparatory entomologist, professional photographer (Kovin); Vlada Žikić, biologist, entomologist (Niš).

The studied material includes the specimens from the Collection of Heteroptera by Nikola Kormilev, which originated in the period of 1927-1945. This material was mostly collected in Macedonia and Serbia. It is presently stored in the Natural History Museum in Belgrade. After his move to America, first to Argentina and then to United States, he was unaware of the real condition of "Yugoslav" collection for over 20 years. In late 1970s I started correspondence with Kormilev, who was glad that his collection was safely stored in the Museum and sent one box of tropical Heteroptera as a gift. That material included two species of fam. Reduviidae: *Rhodnius prolixus* Stål and *Triatoma megista* Neiva, collected by Nikola Kormilev.

Order of species in this paper follows the Catalogue of the Heteroptera of the Palearctic Region (Aukema & Rieger 1996). Many of the details of distribution of certain species and the key for revision of certain problematic species were found in the most recent monograph on the subject (Putshkov & Moulet 2009).

The species list does not include data on sex for a smaller number of specimens due to damage on abdomen or poor preservation.

Abbreviations in chapter Results: AU = Austria, BH = Bosnia & Herzegovina, CR = Croatia, GE = Germany, GR = Greece, HU = Hungary, IT = Italy, MC = Macedonia, ME = Montenegro, MO = Morocco, RO = Romania, RS = Serbia, SL = Slovenia, TU = Tunisia; P&M = Putshkov & Moulet (2009); CHP = Catalogue of the Heteroptera of the Palearctic Region, Dist. = Distribution.

RESULTS

List of records
REDUVIIDAE
ECTRICHODIINAE

Stenolemus novaki Horváth, 1888

CR: Korčula (Curzola) 19.05.1926. 1m leg. P. Novak (PN).

Dist.: Mediterranean.

Ref. Horváth 1888, Novak & Wagner 1951.

CHP: „YU“ – delete.

Note: The type specimen was collected by Petar Novak, as a 8-year-old boy, on the island Hvar, locality Brusje, in May 1888.

Ploiaria domestica (Scopoli, 1786)

CR: Sućurac 08.1923. 1f; 05.06.1924. 1m leg. P. Novak (PN).

MC: Skoplje 13.10.1935. 1m leg. N. Kormilev; Sv. Nikole 07.10.1940. 1m leg. N. Kormilev (NK).

RS: Zaječar 26.08.1910. 1f leg. D. Stojićević (SZ) Beograd: Radmilovac 11.1992. 1f pear orchard, litter leg. Lj. Protić (SZ).

Dist.: Euro-Mediterranean.

Ref. Kormilev 1936, Novak & Wagner 1951; Protić 1993, 1990, 1998.

CHP: Replace “YU” with Serbia (RS).

P&M: There is a mistake with Skoplje 13.08.1917. Schulze (1919). Schulze was a collector, and therefore is not included in the references either, the information was published by Schummacher (1918).

There is a mistake of Radmilovac 1912, that should read: Beograd: Radmilovac 11.1992. (Protić 1998).

Metapterus caspicus (Dohrn, 1863)

MC: Dojran 09.09.1937. 1m leg. N. Kormilev, Skoplje 03.04.1938. 1f leg. S. Karaman (NK).

SL: Podčetrtek 30.10.1934. 1f leg. Dr. Jaeger (NK).

Dist.: Turano-mediterranean.

Ref. Kormilev 1938, Sienkiewicz 1964, Protić 1998.

Note: After the review and statements of Andrej Gogala, that in Slovenia there are no known specimens of *Metapterus linearis* Costa, we have done the redetermination of all specimens of this species in the Kormilev's collection. Now we verify all specimens identified as *M. linearis* are *M. caspicus*.

Phonoctonus fasciatus (de Beauvois, 1805)

Cameroun: Yaounde 08.1969. leg. G. Nonveiller (PP).

The collection of Indian butterflies by Andraš Galac includes *Vacharia natolica* Stal and *Glymmatophora* sp. Collection of Insects by Institute for Plant Protection includes a specimen from Cameroon (Africa), collected by Prof. Nonveiller in 1970. It is probably a genus connected to cocoa plantations. The Presidency of SFRY made a gift to the Natural History Museum in 1982, consisting of two exhibition tables with prepared insect specimens from Guinea (Africa), including two representatives of Reduviidae: *Glymmatophora* sp. and *Platymeris biguttata* Linnaeus.

Table 1. - Five most common species of family Reduviidae in Serbia. The other species were recorded in fewer than ten localities, with fewer than ten collected specimens.

Species	Number of specimens	Number of localities
<i>Peirates hybridus</i> (Scopoli)	31	13
<i>Phymata crassipes</i> (Fabricius)	64	55
<i>Reduvius personatus</i> (Linnaeus)	36	21
<i>Coranus subapterus</i> (De Geer)	14	11
<i>Rhynocoris iracundus</i> (Poda)	113	62

DISCUSSION AND CONCLUSIONS

The study included 376 specimens, collected in period 1910-2010. The collections include a total of 28 species. There were 16 species collected from 83 sites in Serbia, 12 species from 27 sites in Macedonia, 11 species from 19 sites in Croatia, 7 species from 10 sites in Montenegro, 4 species from 4 sites in Greece, 4 species from 2 sites in Slovenia, 2 species from 2 sites in Germany, while the record for other countries includes only a single species collected at a single site (Austria, Bosnia-Herzegovina, Brazil, Hungary, Italy, Morocco, Tunisia, Venezuela).

The distribution patterns of 27 recorded species are as follows: 16 Mediterranean, 4 European, 2 Eurosiberian, 2 Palaearctic, and a single species with Holarctic, African-Asian and cosmopolitan type of distribution.

Of the total number of species from the family Reduviidae recorded in Serbia, *Rhynocoris iracundus* (Poda) has the greatest number of specimens and sites where it was collected, followed by *Phymata crassipes* (Fabricius) and *Reduvius personatus* (Linnaeus) (Tab. 1).

Within the period of 80 years, *Ploiaria domestica* (Scopoli) was recorded in Serbia at only two localities. The first record was from Eastern Serbia (locality Zaječar) and another was from vicinity of Belgrade, in the leaf litter of a pear orchard.

Empicoris vagabundus (Linnaeus) is a new species in the fauna of Serbia. So far it was recorded at two sites: in the broader vicinity of Belgrade (village Draževac), geographical coordinates $44^{\circ} 34' 23''$ N, $20^{\circ} 13' 31''$ E, at an altitude of 130 m; and in Srem, locality Stari Slankamen, near Danube on a bare loess slope, geographical coordinates $20^{\circ} 15' 27''$ N, 45.1428, $20^{\circ} 25' 75''$ E at the altitude of 80 m.

The European species *Empicoris baerensprugi* (Dohrn) was recorded in Serbia only at Leskovac (Kormilev 1936). The specimen was not preserved, and the only information is literature data.

The Dissertation Thesis by Zoran Gradojević (1963) was based on a study of succession of Arthropoda in the area of Deliblato Sands. Among the species of insects and Heteroptera he cites two interesting species from family Reduviidae: *Empicoris culiciformis* (De Geer) and *Sphedanolestes lividigaster* (Mulsant & Rey), which were never recorded in Serbia again, ever after 50 years. *S. lividigaster* is not included in the Collection by Zoran Gradojević, which has been stored and conserved in the Entomological Collection of Natural History Museum in Belgrade since July 2010. As Gradojević had his Heteroptera specimens determined by Dr. Ludvik Hoberlandt from Prague, I assumed that maybe some specimens remained in Prague. Petr Kment checked the specimens in the collection and found none from Serbia.

Oncocephalus pilicornis Herrich-Schaeffer is a new species in the fauna of Montenegro. In the adjacent regions so far it was recorded in Dalmatia and Bosnia and Herzegovina (Protić, 1998).

Oncocephalus squalidus (Rossi) is a Mediterranean species that was recorded in Serbia only at two localities: in Leskovac, more than 70 years ago (leg. Kormilev) and in Đerdap Gorge, locality Tekija, where it was collected 50 years ago (leg. Čubrilović).

Pygolampus bidentata (Goeze) was recorded in Serbia only at two sites. Long ago, in 1900, it was collected in Belgrade (Horváth 1903) but that specimen is not stored in Natural History Museum in Belgrade. Instead there is another specimen in collection that is a female collected in vicinity of Smederevo in 1988. According to the present knowledge of range of this species (Putshkov & Moulet 2009), the locality Smederevo is situated at its eastern boundary.

Rhynocoris annulatus (Linnaeus) has just three known records from Serbia: Rudnik (Csiki 1940), Majdanpek (Živojinović 1950), and previously unpublished locality Zlatar, where a male specimen from the Collection was collected.

The studied collections do not include any specimens of *Rhynocoris niger* (Herrich-Schaeffer). There is only a citation in literature (Horváth 1897). More than 100 years ago it was collected in Srem, at the locality Ruma. It is the only known record of this species in Serbia.

Rhynocoris rubricus (Germar) was considered an Italian-Dalmatian species. However, some records were proven in other Mediterranean countries, as well as in Austria, Slovakia and Czech Republic (Putshkov & Moulet 2009). Specimens stored in the collection of Natural History

Museum in Belgrade were collected in Dalmatia and Montenegro, at the eastern boundary of this species' range.

Csiki (1940) had cited the locality Peć (Serbia: Metohija) where he had collected *Rhinocoris cuspidatus* Ribaut. There is no proof specimen, so it is impossible to check the identification. According to the expert Pavel Pučkov (1996) this is a case of false identification and this is most probably species *Rhynocoris iracundus* (Poda). *Rhinocoris cuspidatus* Ribaut is a North - Western Mediterranean species distributed in Spain, Portugal, France, Andora (Putshkov & Moulet 2009).

Acknowledgement

I am grateful to my colleague and respected associate, Dipl. Ing. Aleksandar Stojanović, on preparing the drawing specimens *Empicoris vagabundus* (Linnaeus).

I am grateful to my friend and colleague Dr. Andrej Gogala on detailed and professional corrections, and suggestion to verify the determination of the specimens identified as *M. linearis* in the collection of Nicholas Kormilev.

I am grateful to my colleague Petr Kment from Prague on checking the specimens of species *Sphedanolestes lividigaster* (Mulsant & Rey) in their collections.

РЕЗИМЕ

У раду су обједињене информације о примерцима фамилије Reduviidae, који се налазе у саставу више збирки Нетероптера у Ентомолошкој збирци Природњачког музеја у Београду. Укупно је обрађено 376 примерка, а идентификовано је 28 врста.

Empicoris vagabundus (Linnaeus) је нова за фауну Србије.

Најбројнији су примерци из Србије, Македоније и Хрватске (Далмација). Објављени су подаци о врстама уловљеним после објављивања Каталога (Protić 1998), као и о старим примерцима, који се деценијама чувају у збирци и који до сада нису публиковани.
